As a combinatorial object, a *Kashiwara crystal* of a given type, rank *n*, and shape $\lambda = (\lambda_1 \ge \lambda_2 \ge \ldots \ge \lambda_n)$ is

- 1. a set B
- 2. along with the maps $e_i, f_i : B \to B \cup \{0\}$ (for $1 \le i \le n$).

Crystal graph: directed graph on B with edges colored $b \xrightarrow{i} b'$ exactly for $f_i(b) = b'$.

<ロ>

Crystals for certain affine Lie algebras $\hat{\mathfrak{g}}.$

Crystals for certain affine Lie algebras $\hat{\mathfrak{g}}.$

The corresponding crystals have operators $f_0, f_1, \ldots f_n$.

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

Crystals for certain affine Lie algebras $\boldsymbol{\hat{\mathfrak{g}}}.$

The corresponding crystals have operators $f_0, f_1, \ldots f_n$.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Labeled by $p \times q$ rectangles, and denoted $\mathbf{B}^{p,q}$.

Crystals for certain affine Lie algebras $\hat{\mathfrak{g}}$.

The corresponding crystals have operators $f_0, f_1, \ldots f_n$.

Labeled by $p \times q$ rectangles, and denoted $\mathbf{B}^{p,q}$.

Definition. Given a partition $\lambda = (\lambda_1, \lambda_2, \dots, \lambda_n)$, let

$$\mathbf{B}^{\lambda} = \mathbf{B}^{\lambda_{1}^{\prime},1} \otimes \mathbf{B}^{\lambda_{m}^{\prime},1} \otimes \dots$$

The crystal operators are defined on \mathbf{B}^{λ} by a tensor product rule.

Definition. Given a partition $\lambda = (\lambda_1, \dots, \lambda_n)$, we associate with it a sequence of transpositions, called a λ -chain:

$$\Gamma(\lambda)=(t_1,t_2,\ldots,t_m).$$

We consider subsets of positions in Γ ,

$$J = (j_1 < j_2 < \ldots < j_s) \subseteq \{1, \ldots, m\}.$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Definition. Given a partition $\lambda = (\lambda_1, \dots, \lambda_n)$, we associate with it a sequence of transpositions, called a λ -chain:

$$\Gamma(\lambda)=(t_1,t_2,\ldots,t_m).$$

We consider subsets of positions in Γ ,

$$J = (j_1 < j_2 < \ldots < j_s) \subseteq \{1, \ldots, m\}.$$

Definition. A subset J is *admissible* if we have a path in the quantum Bruhat graph

$$Id = w \xrightarrow{t_{j_1}} w_{t_{j_1}} \xrightarrow{t_{j_2}} w_{t_{j_1}t_{j_2}} \dots \xrightarrow{t_{j_s}} w_{t_{j_1}t_{j_2}t_{j_s}}.$$

Definition. Given a partition $\lambda = (\lambda_1, \dots, \lambda_n)$, we associate with it a sequence of transpositions, called a λ -chain:

$$\Gamma(\lambda)=(t_1,t_2,\ldots,t_m).$$

We consider subsets of positions in Γ ,

$$J = (j_1 < j_2 < \ldots < j_s) \subseteq \{1, \ldots, m\}.$$

Definition. A subset J is *admissible* if we have a path in the quantum Bruhat graph

$$Id = w \xrightarrow{t_{j_1}} w_{t_{j_1}} \xrightarrow{t_{j_2}} w_{t_{j_1}t_{j_2}} \dots \xrightarrow{t_{j_s}} w_{t_{j_1}t_{j_2}t_{j_s}}.$$

Theorem [Lenart , Naito , Sagaki , Schilling , Shimozono , 2017] The collection of all admissible subsets, $\mathcal{A}(\Gamma)$, is a combinatorial model for \mathbf{B}^{λ} .

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ● ◆ ○ ○ ○

We build a forgetful map $fill : \mathcal{A}(\Gamma(\lambda)) \to Tableau(\lambda)$.

(ロ)、(型)、(E)、(E)、 E) のQ(()

We build a forgetful map $fill : \mathcal{A}(\Gamma(\lambda)) \to Tableau(\lambda)$.

Example Consider type A with n = 4 and $\lambda = (3, 2, 1, 0)$.

We build a forgetful map $fill : \mathcal{A}(\Gamma(\lambda)) \to Tableau(\lambda)$.

Example Consider type A with n = 4 and $\lambda = (3, 2, 1, 0)$. Then the associated λ -chain is

 $\Gamma(\lambda) = ((3,4), (2,4), (1,4)|(2,3), (2,4), (1,3), (1,4)|(1,2), (1,3), (1,4)).$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ● ◆ ○ ○ ○

Example $J = \{1, 2, 4, 5, 8\} \in \mathcal{A}(\Gamma)$ and $\lambda = (3, 2, 1, 0)$.

(ロ)、(型)、(E)、(E)、 E) のQ(()

Example $J = \{1, 2, 4, 5, 8\} \in \mathcal{A}(\Gamma)$ and $\lambda = (3, 2, 1, 0)$.

 $(\underline{(3,4)},\underline{(2,4)},(1,4)|\underline{(2,3)},\underline{(2,4)},(1,3),(1,4)|\underline{(1,2)},(1,3),(1,4))$

Example
$$J = \{1, 2, 4, 5, 8\} \in \mathcal{A}(\Gamma)$$
 and $\lambda = (3, 2, 1, 0)$.
 $(\underline{(3, 4)}, \underline{(2, 4)}, (1, 4)|\underline{(2, 3)}, \underline{(2, 4)}, (1, 3), (1, 4)|\underline{(1, 2)}, (1, 3), (1, 4)|$

We get the corresponding path in the quantum Bruhat graph

イロト イヨト イヨト

Example
$$J = \{1, 2, 4, 5, 8\} \in \mathcal{A}(\Gamma)$$
 and $\lambda = (3, 2, 1, 0)$.
 $(\underline{(3, 4)}, \underline{(2, 4)}, (1, 4)|\underline{(2, 3)}, \underline{(2, 4)}, (1, 3), (1, 4)|\underline{(1, 2)}, (1, 3), (1, 4)|$

We get the corresponding path in the quantum Bruhat graph

(日)

The blue columns (with entries sorted increasingly)

Example
$$J = \{1, 2, 4, 5, 8\} \in \mathcal{A}(\Gamma)$$
 and $\lambda = (3, 2, 1, 0)$.
 $(\underline{(3, 4)}, \underline{(2, 4)}, (1, 4)|\underline{(2, 3)}, \underline{(2, 4)}, (1, 3), (1, 4)|\underline{(1, 2)}, (1, 3), (1, 4)|$

We get the corresponding path in the quantum Bruhat graph

The blue columns (with entries sorted increasingly) then give us fill(J) =

イロト イヨト イヨト

▲□▶ ▲□▶ ▲ 三▶ ▲ 三 ● ● ●

This is done with two algorithms: Reorder and Path

(ロ)、(型)、(E)、(E)、 E) のQ(()

This is done with two algorithms: Reorder and Path

The Reorder algorithm undoes the "increasingly sorted" part of the fill map.

(ロ)、(型)、(E)、(E)、 E) の(()

This is done with two algorithms: Reorder and Path

The Reorder algorithm undoes the "increasingly sorted" part of the fill map.

The Path algorithm then parses through the transpositions of Γ to select the correct path through the quantum Bruhat graph.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

This is done with two algorithms: Reorder and Path

The Reorder algorithm undoes the "increasingly sorted" part of the fill map.

The Path algorithm then parses through the transpositions of Γ to select the correct path through the quantum Bruhat graph.

The resulting bijection is a crystal isomorphism [Lenart, Lubovsky, 2015].

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

The Type C_n Map

- The filling map is similar.
- The inverse map has one major change. Many KN columns have both i and i in them, so we use the splitting algorithm [Lecouvey] to bijectively make two columns with no i, i pairs in either.
- Example:

The $\Gamma(k)$ in type C_n comes in two parts.

One traverses the split columns and the other moves to the next column.

Then similar Reorder and Path algorithms work.

So now the reverse map is made up of a process of Split, Reorder, and Path.

The Type B_n Map

- There is a similar filling map
- For the reverse, similar to C_n , we need a splitting map.
- Recall that we now have columns of length k 2l, so we need to Extend back to length k [Briggs].
- Further, the Path algorithm and Reorder algorithm no longer work.
- There is a configuration of two columns CC' that we call being blocked-off.
- Modify Path and Modify Reorder to avoid block-off pattern.

Blocked-Off Pattern

Definition: We say that columns $L = (l_1, l_2, ..., l_k), R' = (r_1, r_2, ..., r_k)$ are blocked off at i by $b = r_i$ iff $0 < b \ge |l_i|$ and

$$\{1, 2, ..., b\} \subset \{|I_1|, |I_2|, ..., |I_i|\}$$

and

$$\{1, 2, ..., b\} \subset \{|r_1|, |r_2|, ..., |r_i|\}$$

and $|\{j : 1 \le j \le i, l_j < 0, r_j > 0\}|$ is odd.

Example: The following columns CC' of height 5 with entries from $\overline{[8]}$ are blocked-off at 4 by 3:

1	1
4	5
$\overline{2}$	$\overline{2}$
3	3
5	8

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ● ●

The Type D_n Map

- There is a similar filling map
- The splitting and Extend maps extend naturally.
- ► There is a Type *D* blocked-off pattern.
- Modify Path and Modify Reorder to avoid the new block-off pattern.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

Recent Work

The bijections for types B_n and D_n given here are actually crystal isomorphisms. In progress with undergraduate student.

 Efficient combinatorial computation for energy function for types B and D.

Explicit computation of so-called *non-Dual-demazure* arrows in types *B* and *D*.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

What is next?

Explicit computation of *non-Dual-demazure* arrows in types A, C.

Explicit embedding of the more generation rectangular shape into tensor product of column shape KR crystals.
